**CITATION:** Pallet, K. and H. Gosch. 2006. Non-target terrestrial plants: Vegetative Vigor test (Tier 2), AE 0317309+Mefenpyr di-ethyl+Bromoxynil (Code: AE 0317309 03 EC23 A8). Unpublished study performed by Bayer CropScience GmbH, Frankfurt am Main, Germany. Laboratory report number VV 05/002. Study sponsored by Bayer CropScience GmbH, Frankfurt am Main, Germany. Study completed on January 24, 2006.

**DISCLAIMER:** This document provides guidance for EPA and PMRA reviewers on how to complete a data evaluation record after reviewing a scientific study concerning the acute toxicity of a pesticide to terrestrial vascular plants. It is not intended to prescribe conditions to any external party for conducting this study nor to establish absolute criteria regarding the assessment of whether the study is scientifically sound and whether the study satisfies any applicable data requirements. Reviewers are expected to review and to determine for each study, on a case-by-case basis, whether it is scientifically sound and provides sufficient information to satisfy applicable data requirements. Studies that fail to meet any of the conditions may be accepted, if appropriate; similarly, studies that meet all of the conditions may be rejected, if appropriate. In sum, the reviewer is to take into account the totality of factors related to the test methodology and results in determining the acceptability of the study.

US EPA ARCHIVE DOCUMENT

# Data Evaluation Report on the Acute Toxicity of AE 0317309 03 EC23 A8 to Terrestrial Vascular Plants: Vegetative Vigor

PMRA Submission Number 2006-2447

EPA MRID Number 468019-37

## EXECUTIVE SUMMARY:

The effect of AE 0317309 03 EC23 A8 (formulation containing the active ingredients AE 0317309 [pyrasulfotole] at 37.5 g a.i./L plus bromoxynil at 210 g a.i./L) on the vegetative vigor of monocot (corn, *Zea mays*; oat, *Avena sativa*; onion, *Allium cepa*; and ryegrass, *Lolium perenne*) and dicot (cucumber, *Cucumis sativus*; oilseed rape, *Brassica napus*; soybean, *Glycine max*; sugar beet, *Beta vulgaris*; sunflower, *Helianthus annuus L.*; tomato, *Lycopersicon esculentum*) crops was studied at varying nominal application rates. AE 0317309 03 EC23 A8 is proposed for use on selected cereal crops at a one time application rate of up to 1 L product/ha (or, 37.5 g a.i./ha pyrasulfotole) in the US, or 0.83 L product/ha (or, 31.1 g a.i./ha pyrasulfotole) in Canada (note: all rates in this report expressed as a.i. refer to levels of pyrasulfotole). Mean-measured application rates for corn and oat were 0 (negative control), 0.0019, 0.0037, 0.0075, 0.015 and 0.030 lbs ai/A (or, 0, 2.1, 4.1, 8.4, 16.8 and 33.6 g a.i./ha). Mean-measured application rates for onion and ryegrass were 0 (negative control), 0.00094, 0.0019, 0.0037, 0.0075, 0.015 and 0.030 lbs ai/A (or, 0, 1.1, 2.1, 4.1, 8.4, 16.8 and 33.6 g a.i./ha). Mean-measured application rates for cucumber, soybean, sugar beet and sunflower were 0 (negative control), 0.00012, 0.00023, 0.00047, 0.00094, 0.0019 and 0.0037 lbs ai/A (or, 0, 0.13, 0.26, 0.53, 1.1, 2.1 and 4.1 g a.i./ha). Mean-measured application rates for oilseed rape and tomato were 0 (negative control), 0.000063, 0.00012, 0.00023, 0.00047, 0.00094 and 0.0019 lbs ai/A (or, 0, 0.071, 0.13, 0.26, 0.53, 1.1 and 2.1 g a.i./ha). The growth medium used in the vegetative vigor test was natural soil classified as a silty loam with a pH of 7.4 and an organic carbon content of 1.19%. On Day 21 the surviving plants per pot were recorded and cut at soil level for measuring the plant height and dry weight.

In the vegetative vigor test, the plant dry weight, plant height and survival of all dicot species were affected by AE 0317309 03 EC23 A8 treatment. No monocot species exhibited reductions of  $\geq 25\%$  for any endpoint; therefore, the reviewer could not identify a most sensitive monocot. The most sensitive dicot species, based on dry weight, was cucumber with an  $EC_{25}$  of 0.00017 lbs ai/A (0.19 g a.i./ha) and a NOAEC of  $<0.00012$  lbs ai/A ( $<0.13$  g a.i./ha). The  $EC_{05}$  and  $EC_{10}$  values for cucumber dry weight were determined using Nuthatch (0.000016 and 0.000038 lbs ai/A, respectively [or, 0.018 and 0.043 g a.i./ha]), however, there was considerable inhibition at all treatment levels, including 18% at the lowest level.

The following phytotoxic effects were noted: chlorosis, bleaching, necrosis, stunting, leaf deformation, wilting and growth suppression.

**Maximum Labeled Rate:** Not reported

## Results Synopsis

### Monocot

## Dicot

EC<sub>05</sub>/IC<sub>05</sub>: 0.000016 lbs ai/A (0.018 g a.i./ha) 95% C.I.: 0.0000022 – 0.00011 (0.0025 – 0.12 g a.i./ha)

EC<sub>25</sub>/IC<sub>25</sub>: 0.00017 lbs ai/A (0.19 g a.i./ha) 95% C.I.: 5.5E<sup>-05</sup>-0.00053 lbs ai/A (0.062 – 0.59 g a.i./ha)

EC<sub>50</sub>/IC<sub>50</sub>: 0.00090 lbs ai/A (1.0 g a.i./ha) 95% C.I.: 0.00046-0.0017 lbs ai/A (0.52 – 1.9 g a.i./ha)

NOAEC: <0.00012 lbs ai/A (<0.13 g a.i./ha)

Slope: 0.935

Std err: 0.176

Most sensitive dicot: Cucumber

Most sensitive parameter: Dry Weight

This toxicity study is classified as **SUPPLEMENTAL** to the US EPA and **ACCEPTABLE** to the PMRA and does satisfy the guideline requirement for a Tier II terrestrial plant vegetative vigor toxicity study.

**Table 1a. Summary of most sensitive parameters by species (lbs ai/A).**

Species	Endpoint	NOAEC	EC <sub>05</sub>	EC <sub>25</sub>	EC <sub>50</sub>
Corn	Dry Weight	0.030	0.0077	>0.030	>0.030
Oat	Dry Weight	0.015	ND	>0.030	>0.030
Onion	Plant Height	0.015	ND	>0.030	>0.030
Ryegrass	Plant Height	0.015	0.024	>0.030	>0.030
Cucumber	Dry Weight	<0.00012	0.000016	0.00017	0.00090
Oilseed rape	Dry Weight	<0.000063	0.00029	0.00051	0.00077
Soybean	Dry Weight	0.00047	0.0016	0.0021	0.0026
Sugar beet	Dry Weight	0.00023	0.000032	0.00027	0.0012
Sunflower	Plant Height	0.00047	0.00010	0.00037	0.0011
Tomato	Dry Weight	0.00094	0.00074	0.0011	0.0015

**Table 1b. Summary of most sensitive parameters by species (g a.i./ha).**

Species	Endpoint	NOAEC	EC <sub>05</sub>	EC <sub>25</sub>	EC <sub>50</sub>
Corn	Dry Weight	33.6	8.6	>33.6	>33.6
Oat	Dry Weight	16.8	ND	>33.6	>33.6
Onion	Plant Height	16.8	ND	>33.6	>33.6
Ryegrass	Plant Height	16.8	26.9	>33.6	>33.6
Cucumber	Dry Weight	<0.13	0.018	0.19	1.0
Oilseed rape	Dry Weight	<0.071	0.33	0.57	0.86
Soybean	Dry Weight	0.53	1.8	2.4	2.9
Sugar beet	Dry Weight	0.26	0.036	0.30	1.3
Sunflower	Plant Height	0.53	0.11	0.41	1.2
Tomato	Dry Weight	1.1	0.83	1.2	1.7

## I. MATERIALS AND METHODS

### GUIDELINE FOLLOWED:

The study followed guidelines outlined in US EPA Pesticide Assessment Guidelines, Sub-division J, Hazard Evaluation, Non-Target Plants, PB83-153940, EPA540/9-82-020, Series 123, Tier 2 of Non-Target Area Testing and OECD, Guideline for the testing of chemicals, Guideline 208, Terrestrial (Non-Target) Plant Test, 208 A, Seedling Emergence and Seedling Growth Test and 208 B, Vegetative Vigor test. The following deviations were noted:

# Data Evaluation Report on the Acute Toxicity of AE 0317309 03 EC23 A8 to Terrestrial Vascular Plants: Vegetative Vigor

PMRA Submission Number 2006-2447

EPA MRID Number 468019-37

1. The maximum label rate of the test material was not reported.
2. The physiochemical properties of the test material were not reported.
3. The LOQ and LOD were not reported.
4. The geographic location, CEC and moisture content at 1/3 atmospheres were not reported.
5. All species were tested under the same environmental conditions instead of testing cold-preferring species separately from warm-preferring species.
6. A NOAEC could not be identified for cucumber dry weight, the most sensitive endpoint, due to inhibition (18%) at the lowest treatment level (although this was not statistically significantly different than the control).
7. The reviewer was unable to statistically analyze cucumber plant height and oilseed rape plant height as the raw data for these species and endpoints were not provided.
8. Pots were initially top watered to facilitate germination and establish the water column (prior to being treated). Thereafter, water was applied via subirrigation by adding water to saucers below the pots.
9. Minor deviations in temperature occurred for short periods of time when the temperature reached as high as 26°C and as low as 18°C. The same occurred with the relative humidity which ranged from 35 to 98%.

The deviations do not impact the acceptability of the study.

## COMPLIANCE:

Signed and dated No Data Confidentiality, GLP and Quality Assurance statements were provided. This study was performed in compliance with the Principles of Good Laboratory Practice, Annex 1 to Chemicals Act of Federal Republic of Germany in the current version [Grundätze der Guten Laborpraxis (GLP), Anhang 1 zum Chemikaliengesetz der Bundesrepublik Deutschland in der aktuellen Fassung] based on the OECD Principles of Good Laboratory Practice as revised in 1997 and adopted November 26<sup>th</sup>, 1997 by decision of the OECD Council [C(97)186/Final].

## A. MATERIALS:

<b>1. Test Material</b>	AE 0317309 03 EC23 A8
<b>Description:</b>	Amber Liquid
<b>Lot No./Batch No. :</b>	04KLE001P059 (Batch No.)
<b>Purity:</b>	3.45% wt/wt
<b>Stability of compound under test conditions:</b>	Samples of the stock solutions were collected at Day 0 and analyzed for AE 0317309. The recovery was 99.4-100.3% of nominal. ( <i>OECD recommends chemical stability in water and light</i> )
<b>Storage conditions of test chemicals:</b>	Stored under ambient conditions.

**Data Evaluation Report on the Acute Toxicity of AE 0317309 03 EC23 A8 to Terrestrial Vascular Plants: Vegetative Vigor**

PMRA Submission Number 2006-2447

EPA MRID Number 468019-37

**Table 2. Physical/chemical properties of AE 0317309 03 EC23 A8.**

Parameter	Values	Comments
Water solubility at 20EC	Not reported	
Vapor pressure	Not reported	
UV absorption	Not reported	
pKa	Not reported	
Kow	Not reported	

**2. Test organism:**

**Monocotyledonous species:** Corn (*Zea mays*, Family Poaceae, Lorenzo), Oat (*Avena sativa*, Family Poaceae, Flämings Nova), Onion (*Allium cepa*, Family Liliaceae, Braunschweiger Blutrote) and Ryegrass (*Lolium perenne*, Family Poaceae, Deutsches Weidegras); *EPA recommends four monocots in two families, including corn.*

**Dicotyledonous species:** Cucumber (*Cucumis sativus*, Family Cucurbitaceae, Delikatess), Oilseed rape (*Brassica napus*, Family Brassicaceae, Licapo), Soybean (*Glycine max*, Family Fabaceae, Erin), Sugar beet (*Beta vulgaris*, Family Chenopodiaceae, Achat), Sunflower (*Helianthus annuus L.*, Family Asteraceae, Big Smile) and Tomato (*Lycopersicon esculentum*, Family Solanaceae, Balkonstar); *EPA recommends six dicots in four families, including soybean and a root crop.*

*OECD recommends a minimum of three species selected for testing, at least one from each of the following categories: Category 1: ryegrass, rice, oat, wheat, and sorghum; Category 2: mustard, rape, radish, turnip, and Chinese cabbage; Category 3: vetch, mung bean, red clover, fenugreek, lettuce, and cress.*

**Seed source:** Seeds were supplied from commercial sources via Bayer CropScience GmbH, Horticulture, H872, 65926 Frankfurt am Main.

**Prior seed treatment/sterilization:** None

**Historical % germination of seed:** Germination was not reported; however, the study authors reported that germination tests were conducted to ensure viability of the seeds.

**Seed storage, if any:** Seeds were stored in plastic boxes in the refrigerator

**B. STUDY DESIGN:**

**1. Experimental Conditions**

- a. Limit test: A limit test was not conducted.
- b. Range-finding study: A range-finding study was not conducted.
- c. Definitive Study

EPA MRID Number 468019-37

**2. Observations:**

**Table 4: Observation Parameters - Vegetative Vigor**

Parameters	Vegetative Vigor	
	Details	Remarks
Parameters measured (i.e., plant height, dry weight or other endpoints)	Survival, phytotoxicity, growth stage, plant dry weight and length.	
Measurement technique for each parameter	Survival was determined by visual enumeration. Plant length was determined by measuring the total shoot height (i.e. longest leaf) to the nearest 0.1 cm. Dry weight was determined using a balance and weight to the nearest 0.001 g. Phytotoxicity was determined using a numerical rating system.	
Observation intervals	Survival and phytotoxicity were determined weekly. Dry weight, plant height and growth stage were determined at test termination (Day 21).	
Other observations, if any	None	
Were raw data included?	All raw data were provided with the exception of cucumber and oilseed rape plant height. The study authors do not report why these data were not included.	
Phytotoxicity rating system, if used	Phytotoxicity was described using a percentage, which reflected the extent of the symptom. 0%- no injury or effect; 10-20%- slight symptoms throughout the whole plant or more moderate symptoms on a small area; 30-40%- moderate symptoms throughout the whole plant or severe symptoms on a limited area; 50-60%- severe symptoms throughout the	Any plant considered dead was not rated for phytotoxicity.

Parameters	Vegetative Vigor	
	Details	Remarks
	whole plant with younger or newly developed leaves growing normally; 70-80%-total plant symptoms with the plant showing poor vigor; 90%- moribund or dying plant	

**II. RESULTS and DISCUSSION:**

**A. INHIBITORY EFFECTS:**

**Vegetative Vigor:**

No monocot species exhibited a reduction of >25% for any of the endpoints analyzed; although ryegrass did exhibit significant reductions in dry weight and plant height. All dicot species exhibited reductions of >25% for all endpoints analyzed (dry weight, plant height and survival). The responses of the endpoints did not appear completely linear; however, they did appear to be dose-dependent. As no monocot exhibited reductions of >25%, the reviewer cannot accurately identify a most sensitive monocot species. The most sensitive dicot species, based on dry weight, was cucumber with study author-reported NOAEC and EC<sub>25</sub> values of 0.00012 (0.13 g a.i./ha) and 0.000231 lbs ai/A (0.26 g a.i./ha), respectively.

The following effects were noted: chlorosis, bleaching, necrosis, stunting, leaf deformation, wilting and growth suppression. Phytotoxicity was described using a percentage, which reflected the extent of the symptom. 0%- no injury or effect; 10-20%- slight symptoms throughout the whole plant or more moderate symptoms on a small area; 30-40%- moderate symptoms throughout the whole plant or severe symptoms on a limited area; 50-60%- severe symptoms throughout the whole plant with younger or newly developed leaves growing normally; 70-80%- total plant symptoms with the plant showing poor vigor; 90%- moribund or dying plant.

**B. REPORTED STATISTICS:**

The data from all treatment levels was compared to each species respective negative control. Mortality and dry weight were compared using the ToxRat software for statistical analysis (version 2.09). Plant height was also analyzed by comparing treatment data to the control data; however, the statistical software used was not reported.

## C. VERIFICATION OF STATISTICAL RESULTS BY THE REVIEWER:

Statistical Method(s): Replicate data for dry weight, plant height and percent survival were first tested for the assumptions of ANOVA (normality and homogeneity) for any species exhibited a  $\geq 5\%$  reduction relative to the negative control. If these assumptions were met, the NOAEC values were determined by comparing the treatment data against the negative control data using the parametric Dunnetts Test (or Bonferonni's T-Test for unequal replicates) and William's Test. If the assumptions of ANOVA were not met, the NOAEC values were determined by comparing the treatment data against the negative control data using the non-parametric Kruskal-Wallis test. All NOAEC values were determined using Toxstat statistical software. Phytotoxicity was not reported as this is not a quantitative endpoint. The ECx values (with corresponding 95% C.I.) and probit slopes (when applicable) were determined using Nuthatch statistical software. When the % reduction was  $< 5$ ,  $< 25$  or  $< 50\%$ , the respective ECx values were determined visually. When 100% mortality was observed in the highest treatment level, these data were excluded from the analyses. All toxicity values were determined using the mean-measured application rates. The raw data for cucumber plant height and oilseed rape plant height were not provided; therefore, the reviewer was unable to analyze these species and endpoints.

Std err: 0.176

Most sensitive dicot: Cucumber

Most sensitive parameter: Dry Weight

## D. STUDY DEFICIENCIES:

A NOAEC could not be determined for the most sensitive endpoint, cucumber dry weight. Inhibition in biomass at the lowest treatment level was 18%. According to a memo issued by US EPA entitled, "Closure on Nontarget Plant Phytotoxicity Policy Issues" on October 1994, if the lowest test level and the NOAEC are >EC<sub>10</sub>, but <EC<sub>25</sub>, the study may be classified as SUPPLEMENTAL.

## E. REVIEWERS' COMMENTS:

The reviewers' conclusions were identical to the study authors', in that cucumber dry weight was the most sensitive endpoint. The reviewers' toxicity values were slightly lower than the study authors', presumably because they were based on the mean-measured application rates, whereas the study authors' results are based on the nominal application rates. Therefore, the reviewer's results are reported in the Executive Summary and Conclusions sections of this DER.

Raw data were not provided for cucumber plant height and oilseed rape plant height. The page numbering in the relevant portion of the appendix of the original report (Table A.1.4) appears to have been changed at some

## Data Evaluation Report on the Acute Toxicity of AE 0317309 03 EC23 A8 to Terrestrial Vascular Plants: Vegetative Vigor

PMRA Submission Number 2006-2447

EPA MRID Number 468019-37

point, and there may be two pages of raw data missing as a result (i.e., gap between pages 57 and 60 of the 77 pages total). As such, the reviewer was unable to analyze these species' endpoints. Therefore, in the determination of most sensitive dicot species, these two species' endpoints were not taken into consideration. These values were also not included in the determination of the most sensitive parameter for each species, which are reported in Table 1 of this DER. The study author-reported EC<sub>25</sub> values for plant height in cucumber and oilseed rape were approximately twice those of the biomass endpoint, which was considered the most sensitive parameter for effects on both of these dicots. A clarification could be requested from the registrant for the missing data, but it is not expected to change the final assessment for the most sensitive dicot endpoint.

The reviewer was unable to determine the EC<sub>05</sub> (and 95% C.I.) for oat and onion biomass and plant height. However, reliable NOAEC values were determined and the reviewer does not feel that the lack of EC<sub>05</sub> values is detrimental to the acceptability of the study.

Cucumber exhibited reductions of  $\geq 18\%$  in biomass at all treatment levels. Therefore, a NOAEC value could not be determined for this species and endpoint. According to a memo issued by US EPA entitled, "Closure on Nontarget Plant Phytotoxicity Policy Issues" on October 1994, if the lowest test level and the NOAEC are  $>EC_{10}$ , but  $<EC_{25}$ , the study may be classified as SUPPLEMENTAL. However, the lack of a definitive NOAEC will not adversely affect the risk assessment by the PMRA, as a verifiable EC<sub>25</sub> endpoint was available (which is the endpoint used in the Canadian risk assessment to compare effects against expected environmental concentrations).

Sunflower exhibited percent reductions in dry weight of 7, 8, -1, 80, 83 and 64% and reductions in plant height of 5, 10, 11, 65, 64 and 61% at the mean-measured 0.00012, 0.00023, 0.00047, 0.00094, 0.0019 and 0.0037 lbs ai/A treatment levels, respectively, relative to the negative control. The reviewer's analysis yielded NOAEC values of 0.00047 lbs ai/A for both dry weight and plant height; however, the probit analysis yielded EC<sub>25</sub> values of 0.00037 lbs ai/A for both dry weight and plant height. The reviewer feels that this can be attributed to non-linear response to sunflower dry weight to exposure of the test material.

The survival NOAEC values for oilseed rape, soybean, sugar beet, sunflower and tomato were all determined visually. Because the data sets did not meet the assumptions of ANOVA, the analyses were conducted using the non-parametric Kruskal-Wallis test. This test is less sensitive than some of the parametric multiple comparison tests (Dunnett's and Bonferroni's) and did not detect reductions that the reviewer felt were significant. Oilseed rape, sugar beet and sunflower survival was reduced 35, 25 and 45%, respectively, at the mean-measured 0.00094 lbs ai/A treatment level and the reviewer's analysis did not detect a significant difference at this level; therefore, the reviewer visually determined the NOAEC value for oilseed rape, sugar beet and sunflower survival to be 0.00047 lbs ai/A. The reviewer's analysis for soybean survival did not detect a significant difference at any of the treatment levels, despite the 31% reduction at the highest treatment level (0.0037 lbs ai/A). The reviewer felt that this was a significant reduction and therefore visually determined the NOAEC value for soybean survival to be the next lowest treatment level, mean-measured 0.0019 lbs ai/A. As a reduction in soybean survival was only observed at the highest treatment level, probit analysis was unable to generate EC<sub>x</sub> values because only two distinct isotone means were exhibited, where three or more are necessary. The reviewer's analysis for tomato survival did not detect a significant difference at any of the treatment levels, despite the 33% reduction at the highest treatment level (0.0019 lbs ai/A). The reviewer felt that this was a significant reduction and therefore visually determined the NOAEC value for soybean survival to be the next lowest treatment level, mean-measured 0.00094 lbs ai/A. As a reduction in soybean survival was only observed at the highest treatment level, probit analysis was unable to generate EC<sub>x</sub> values because only two distinct isotone means were exhibited, where three or more are necessary.

Species and endpoint where reliable EC<sub>25</sub> values were not determined by the reviewer's analysis could not be taken into consideration when determining the most sensitive dicot species or when determining the most sensitive endpoint for each species, which is reported in Table 1 of this DER. Reliable EC<sub>25</sub> values were not generated for cucumber plant height, oilseed rape plant height, soybean survival and tomato survival.

# Data Evaluation Report on the Acute Toxicity of AE 0317309 03 EC23 A8 to Terrestrial Vascular Plants: Vegetative Vigor

PMRA Submission Number 2006-2447

EPA MRID Number 468019-37

All species were tested under the same environmental conditions instead of testing cold-preferring species separately from warm-preferring species. The less-than-optimal environmental conditions could have had a synergistic effect with the test material, potentially confounding the observed results which are attributed entirely to the exposure of the test material.

Mean-measured application rates for corn and oat were 0 (negative control), 0.0019, 0.0037, 0.0075, 0.015 and 0.030 lbs ai/A (or, 0, 2.1, 4.1, 8.4, 16.8 and 33.6 g a.i./ha). Mean-measured application rates for onion and ryegrass were 0 (negative control), 0.00094, 0.0019, 0.0037, 0.0075, 0.015 and 0.030 lbs ai/A (or, 0, 1.1, 2.1, 4.1, 8.4, 16.8 and 33.6 g a.i./ha). Mean-measured application rates for cucumber, soybean, sugar beet and sunflower were 0 (negative control), 0.00012, 0.00023, 0.00047, 0.00094, 0.0019 and 0.0037 lbs ai/A (or, 0, 0.13, 0.26, 0.53, 1.1, 2.1 and 4.1 g a.i./ha). Mean-measured application rates for oilseed rape and tomato were 0 (negative control), 0.000063, 0.00012, 0.00023, 0.00047, 0.00094 and 0.0019 lbs ai/A (or, 0, 0.071, 0.13, 0.26, 0.53, 1.1 and 2.1 g a.i./ha).

The mean-measured application rates were determined by the reviewer based on the mean recoveries of the ten stock solutions representative of the ten application rates. The reviewer determined the mean recovery for each stock solution and multiplied this value by the nominal application rate to derive the mean-measured application rate.

No monocot species exhibited reductions of  $\geq 25\%$  in dry weight, plant height or survival, relative to the negative control. However, non-significant reductions of  $\geq 5\%$  were observed although  $EC_{05}$  values could not be determined. Therefore, in Table 1 (Summary of Most Sensitive Parameters by Species) the reviewer reported which endpoint(s) for each monocot exhibited non-significant reductions of  $\geq 5\%$ , represented by "ND" in the  $EC_{05}$  column.

The test material, AE 0317309 03 EC23 A8, was a formulation containing the active ingredients AE 0317309 (pyrasulfotole, purity of 3.45% w/w), AE F107892 (mefenpyr-diethyl, purity of 0.85% w/w) and AE F025943 (bromoxynil, purity of 18.94% w/w). The reviewer corrected all nominal application rates for the purity of AE 0317309 and converted these rates into lbs ai/A.

The dates of experimental work for the definitive vegetative vigor test were January 25 to February 25, 2005

Conversion of mean measured treatment rates (lbs a.i./A to g a.i./ha):

lbs ai/A	g a.i./ha
0.000063	0.071
0.00012	0.13
0.00023	0.26
0.00047	0.53
0.00094	1.1
0.0019	2.1
0.0037	4.1
0.0075	8.4
0.015	16.8
0.030	33.6

## F. CONCLUSIONS:

This study is considered scientifically sound and is classified as **SUPPLEMENTAL** to the US EPA and **ACCEPTABLE** to the PMRA. No monocot species exhibited reductions of  $\geq 25\%$  for any endpoint; therefore,

**Data Evaluation Report on the Acute Toxicity of AE 0317309 03 EC23 A8 to Terrestrial Vascular Plants: Vegetative Vigor**

**PMRA Submission Number 2006-2447**

**EPA MRID Number 468019-37**

the reviewer could not identify a most sensitive monocot. The most sensitive dicot species, based on dry weight, was cucumber with an EC<sub>25</sub> of 0.00017 lbs ai/A (0.19 g a.i./ha) and a NOAEC of <0.00012 lbs ai/A (<0.13 g a.i./ha). There was considerable inhibition at all treatment levels, including 18% at the lowest level.

Most sensitive monocot and EC<sub>25</sub>: N/A

Most sensitive dicot and EC<sub>25</sub>: Cucumber (Dry Weight), 0.00017 lbs ai/A (0.19 g a.i./ha)
